Member of the Board, Abacus Research

AbaSmart
foward-looking
and simple

With AbaSmart, the Abacus app for the iPad, various work processes are optimized, considerably increasing the efficiency of a company. Abacus users receive an innovative tool which makes working with the Business Software even simpler. The user-friendly app makes data, information and functions available anytime, anywhere. As a result, entire business processes can be profitably supported and efficiency improvements can be achieved, which creates more space for the core business.
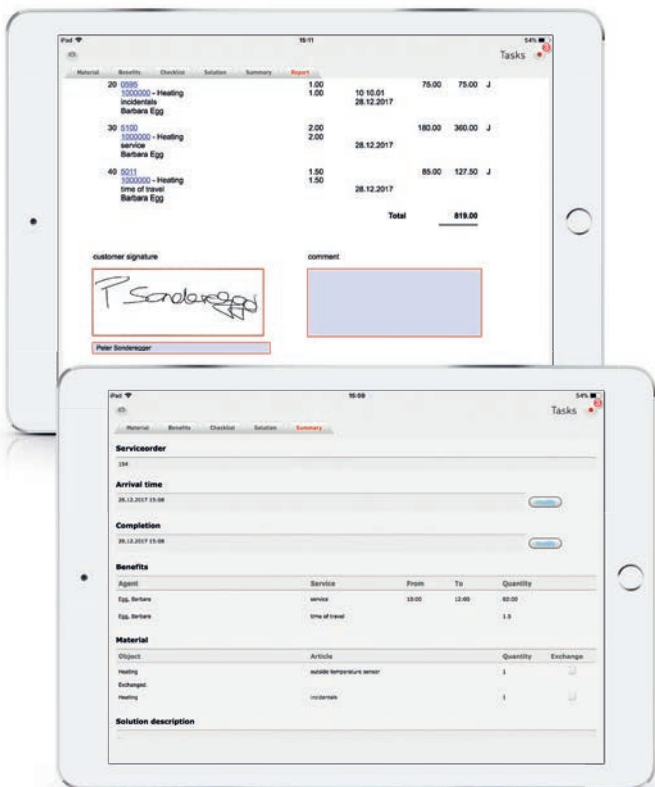

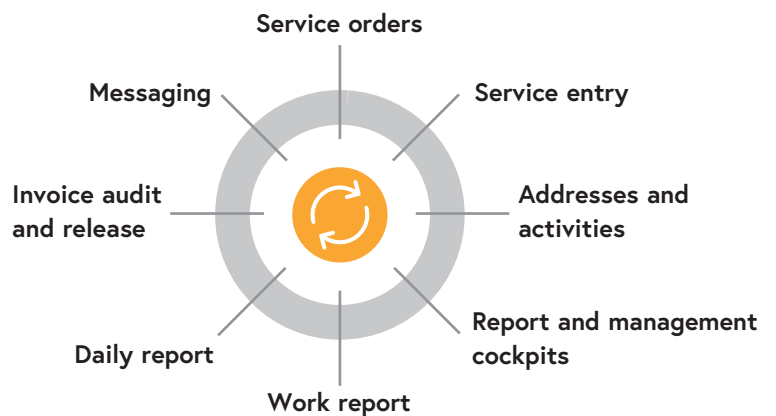

AbaSmart at a glance
- Service orders
- Service entry
- Addresses and activities
- Report and management cockpits
- Work report
- Daily report
- Invoice audit and release
- Messaging

One app, minimum effort, maximum impact

With AbaSmart, employees who are on the move can quickly and easily enter services or their working hours at the project level with just a few taps.

The data is synchronized and immediately ready for further processing in Abacus Business Software. Double entries become a thing of the past. The Internet-based technology offers the app user the possibility to retrieve real-time data at any time from the Abacus Business Software, for example in the form of reports.

- Addresses and activities
- Daily report
- Report and management cockpits
- Work report

Service orders

With AbaSmart, service orders can be completed on the go and synchronized with Abacus Business Software. The service technician receives all relevant information such as error messages, customer information and priorities for the order on the tablet. The time spent on repairs, service interventions, travel time and expenses can easily be recorded. Consumables and spare parts can be selected and ordered directly from the article catalogue. PDF checklists can be displayed on AbaSmart and filled in directly and signed by the service technician. Tasks and messages can also be sent together with self-designed PDF forms.

Report and management cockpits

With the touch of a finger, the user can use AbaSmart to retrieve a wide variety of reports, management cockpits and lists, which are prepared from the modules of Abacus Business Software. The Internet-based technology can be used, for example, to display financial information, customer data or projects in real time.

Work report

The AbaSmart work report offers an entry program for the efficient reporting of the hours worked by multiple employees. The detailed planning for each project serves as the entry template where material used can be entered easily.

Daily report

The daily report for AbaSmart also provides an optimized entry program for the efficient reporting of hours worked, materials, delivery notes and external services on a construction site. The mobile entry of construction work makes paper forms obsolete, the administration is unburdened and up-to-date data on the construction projects are available at all times.

Invoice audit and release

The original creditor invoices can be checked on the tablet via the integrated task function and released for payment at the touch of a button. With AbaSmart, release processes are optimized and implemented in a time-saving manner.

Messaging

The integrated Abacus messaging system enables AbaSmart users to communicate with other Abacus users directly in the Abacus Business Software. The system makes it easy to send messages and efficiently coordinate tasks.

Service entry

With integrated service entry via TimeLine, employees can record their hours worked, expenses, mileage travelled and other work on their mobile devices. Time-consuming and costly reviews can be avoided. The times can be optionally distributed to different projects.
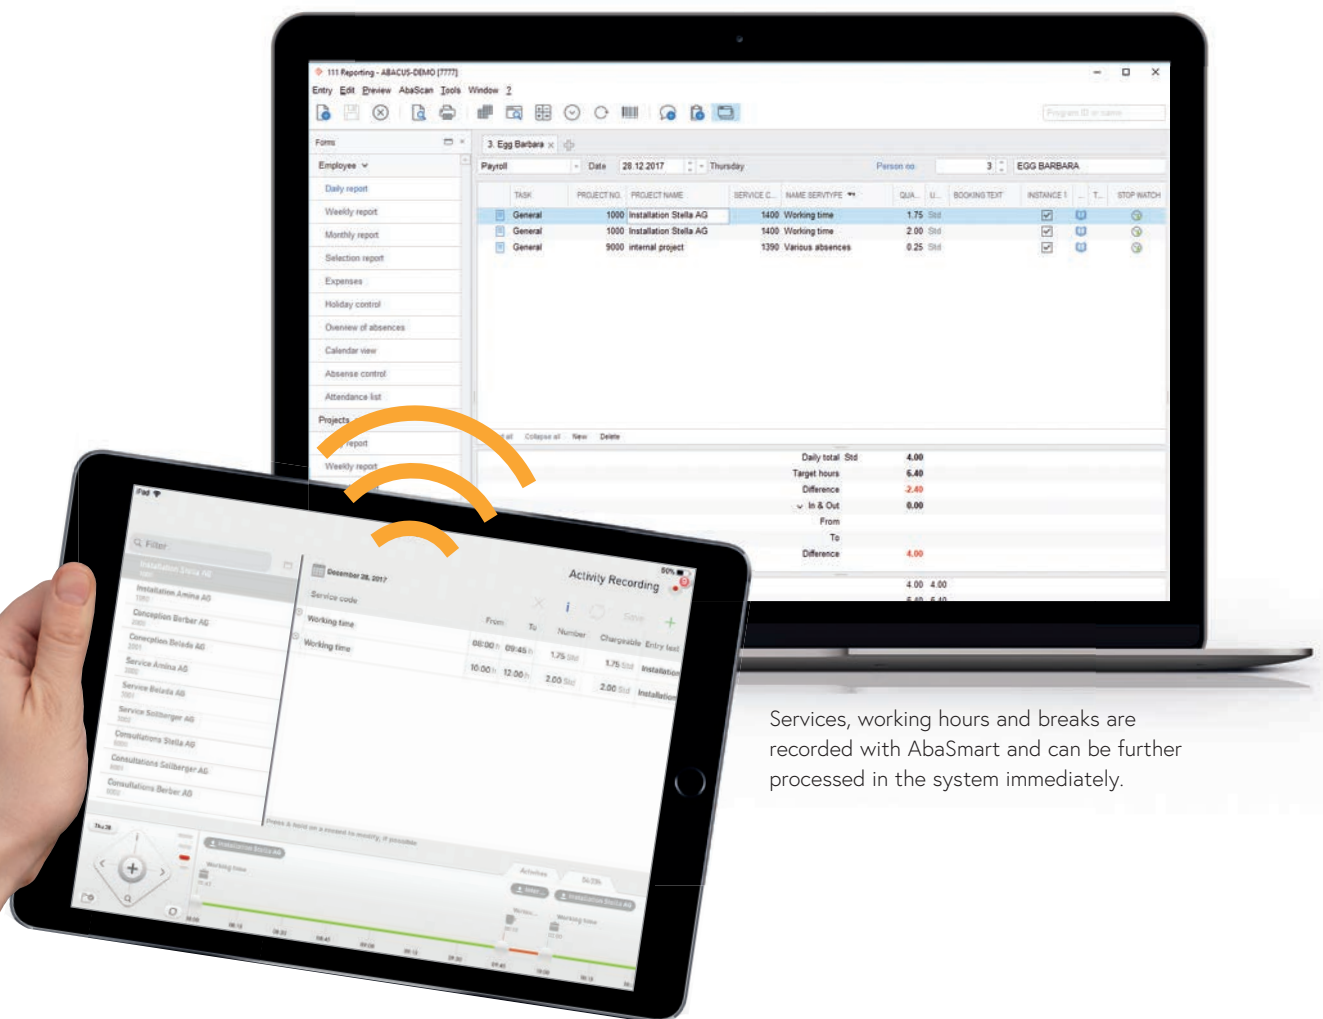

Addresses and activities

Addresses and activities from Abacus CRM can be retrieved in AbaSmart at any time with up-to-date data. In addition, the app enables the mobile capture and editing of CRM data. All contact details from business cards with a QR code can be directly transferred with the help of the camera.

Synchronization with Abacus Business Software

All data collected with AbaCliK, such as expenses, services, or working hours, can be transmitted to Abacus Business Software with the touch of a finger and further processed, evaluated, or archived in real time. Information can also be entered offline in AbaSmart and later synchronized when there is network access. Synchronisation is possible with the following Abacus modules: Project Management, AbaProject, Service and Contract Management, CRM and AbaBuild.

Foward-looking companies retrieve business data via the Internet regardless of time and place. Reports, management cockpits, lists, addresses or activities that have been prepared by Abacus Business Software are available anytime in AbaSmart. If no Internet connection is available, AbaSmart will automatically load the most current information. Errors due to media discontinuity become a thing of the past.

Services, working hours and breaks are recorded with AbaSmart and can be further processed in the system immediately.

Your advantages

Optimise your business processes by introducing AbaCliK, work completely digital and be mobile!

- ✓ Save administrative work, time, and costs
- ✓ Avoid paper chaos, consumption, and multiple copies
- ✓ Continuous digital and lean business processes
